Lau Møller Andersen

- Make sure your notebook conversion actually shows the figures; some of the html's you are providing do not render the figures (tried Firefox, Chromium and Opera). Converting it to pdf is probably more safe
- Instead of plotting time samples on the x-axis, plot time in milliseconds
- In general it is possible to classify PAS around 240 ms, so check your code, if your classifications don't reflect thus
- Be clear about whether you are plotting sensor covariance matrices (102 x 102) or feature covariance matrices (n_features x n_features). Some of you show repetition covariance matrices (n_repetitions x n_repetitions) instead
- Use same colour maps for plots to be compared
- Make sure to read the questions appropriately, e.g.: don't split into training and test if not asked to
