

General feedback – assignment 3

- Remember to write who wrote what – I have to be able to make individual assessments for the exam
- Remember to answer all questions (everything that has a question mark) – it is not just about running the right code, it is also answering the conceptual questions
 - which is where I can gauge how well you have understood the material
- Remember that in in-sample classification, adding noise dimensions should actually help classification (overfitting) – why would adding the last five dimensions then make no difference to the classification
- Remember the differences between percentage points, percent and proportions
- You can use *np.where* to find indices
- Don't print all the eigenvectors; if you want to show them, just include the first few ones
- Make sure you do not show the same plot twice
- Make sure to have meaningful plot labels, e.g. time, not time indices
- Make sure that you have the five missing values on your eigenvalue plot (you need to plot the absolute values)
- Make sure that you have plots that align with your text, I saw an example where a student reported a difference in percentage points between PCA and full, which cannot be seen in one of the accompanying plots, i.e. make sure you plot what you intend to plot.
- For the covariance plots for the PCA, you can make the variance contributed from lower-ranking components much clearer if you change *vmin* and *vmax*.
